## 1 Misc

### 1.1 Input by file

```
freopen("input.txt", "r", stdin);
freopen("output.txt", "w", stdout);
```

## 2 Geometry

### 2.1 Distances

#### 2.1.1 Euclidean

$$d(p, q) = \sqrt{(q.x - p.x)^2 + (q.y - p.y)^2}$$

#### 2.1.2 Manhattan

$$|p.x - q.x| + |p.y - q.y|$$

### 2.2 Maximum possible manhattan distance between two points given n points

Given n points, for instance:

Rotate all coordinates  $45^\circ$  so that  $(x, y)$  becomes  $(x + y, y - x)$ , so,  $p$  becomes  $p'$  and  $q$  becomes  $q'$ .

The maximum manhattan distance is obtaining by choosing the two points that maximize:

$$\max(|p'.x - q'.x|, |p'.y - q'.y|)$$

### 2.3 Boundary points

The number of integer points in the boundary of a polygon is:

$$B = v + b$$

where  $v$  is the number of vertices (integer points as well) and  $b$  is the number of integer points situated between two vertices, like in the following figure:

$b$  can be calculated for every line connecting two points (including the line between the last and the first point) as follows:

$$boundary\_points(p, q) = \begin{cases} |p.y - q.y| - 1 & p.x = q.x \\ |p.x - q.x| - 1 & p.y = q.y \\ gcd(|p.x - q.x|, |p.y - q.y|) - 1 & \text{otherwise} \end{cases}$$

### 2.4 Pick's Theorem

$$A = a + \frac{b}{2} + 1$$

where  $A$  is the area of the polygon,  $a$  is the number of integer points inside the polygon and  $b$  is the number of integer points in the boundary of the polygon

### 2.5 Triangle Existence Condition

$$a + b \geq c$$

$$a + c \geq b$$

$$b + c \geq a$$

**2.6 Perimeter****2.6.1 Circle**

$$2\pi r$$

**2.7 Areas****2.7.1 Circle**

$$\pi r^2$$

**2.7.2 Triangle**

$$\frac{b * h}{2}$$

**2.7.3 Square**

$$l^2$$

**2.7.4 Rectangle**

$$hr$$

**2.7.5 Rhombus**

$D$  is the biggest diagonal and  $d$  is the smallest diagonal

$$A = \frac{1}{2} * D * d$$

**2.8 Volumes****2.8.1 Sphere**

$$\frac{4}{3}\pi r^3$$

**2.8.2 Prism**

$$V = bh$$

**2.8.3 Pyramid**

$$\frac{bh}{3}$$

**2.8.4 Cone**

$$\frac{\pi r^2 h}{3}$$

**2.9 Sines Rule**

$$\frac{a}{\sin(\alpha)} = \frac{b}{\sin(\beta)} = \frac{c}{\sin(\gamma)}$$

**2.10 Cossines Rule**

$$a^2 = b^2 + c^2 - 2bccos(\alpha)$$

**2.11 Shoelace Formula**

$$A = \frac{1}{2} \left| \sum_{i=1}^{n-1} (p_i \times p_{i+1}) \right| = \frac{1}{2} \left| \sum_{i=1}^{n-1} (x_i y_{i+1} - x_{i+1} y_i) \right|$$

Where the points  $p_1, p_n, \dots$  are in adjacent order and the first and last vertex is the same, that is,  $p_1 = p_n$

**3 Bitwise****3.1 Turn bit on and off**

Turn on bit  $i$  x & (1 << i)

Turn off bit  $i$  x & (~ (1 << i))

### 3.2 XOR from 1 to n

$$f(n) = \begin{cases} n & n \equiv 0 \pmod{4} \\ 1 & n \equiv 1 \pmod{4} \\ n+1 & n \equiv 2 \pmod{4} \\ 0 & n \equiv 3 \pmod{4} \end{cases}$$

## 4 Basic Math

### 4.1 Logarithm

$$\log_b mn = \log_b m + \log_b n \quad \log_b \frac{m}{n} = \log_b m - \log_b n \quad \log_b n^p = p \log_b n$$

$$\log_b \sqrt[q]{n} = \frac{1}{q} \log_b n \quad \log_b n = \log_a n \log_b a \quad b^{\log_b k} = k$$

$$\log_b a = \frac{\log_c a}{\log_c b} \quad \log_b a = \frac{1}{\log_a b} \quad \log_b a \log_a c = \log_b c$$

$$\log_b 1 = 0 \quad \log_b b = 1$$

## 5 C++

### 5.1 Ordered set and multiset

```
typedef tree<pair<ll , ll> , null_type , less<pair<ll , ll>> ,
rb_tree_tag , tree_order_statistics_node_update> ordered_set;
```

To change to multiset switch equal to less\_equal.

### 5.2 Priority Queue

```
template<class T> using min_priority_queue =
priority_queue<T , vector<T> , greater<T>>;
```

## 6 Combinatorics

### 6.1 Burnside's Lemma

Burnside's lemma can be used to count the number of combinations so that only one representative is counted for each group of symmetric combinations. For example, if we have a necklace with different colored pearls and we want to know how many different combinations we can make.

For example, if we have a necklace colored like this:

This variations are the same if we consider that we can rotate the necklace:

When the number of steps is k, the number of necklaces that remain the same are:

$$m^{\gcd(k,n)}$$

The number of diferent combinations for m colors and a necklace of size n is

$$\sum_{i=0}^{n-1} \frac{m^{\gcd(i,n)}}{n}$$

So a necklace of length 4 with 3 colors has

$$\frac{3^4 + 3 + 3^2 + 3}{4} = 24$$

## 7 Constants

LLINF = 0x3f3f3f3f3f3f3f3fLL

PI = acos(-1)

## 8 Number Theory

$$(a + b) \bmod m = (a \bmod m + b \bmod m) \bmod m$$

$$(a - b) \bmod m = (a \bmod m - b \bmod m) \bmod m$$

$$(a \times b) \bmod m = ((a \bmod m) \times (b \bmod m)) \bmod m$$

$$a^b \bmod m = (a \bmod m)^b \bmod m$$

$$a \equiv b \pmod{m} \iff (b - a) \mid m$$

$$\gcd(a_1, a_2, a_3, a_4) = \gcd(a_1, \gcd(a_2, \gcd(a_3, a_4)))$$

$$\text{lcm}(a, b) \times \gcd(a, b) = a \times b$$

$$\text{lcm}(a, b) = \frac{a \times b}{\gcd(a, b)} = \frac{a}{\gcd(a, b)} \times b$$

$$\gcd(a, b) = b \text{?} \gcd(b, a \% b) : a$$

### 8.1 Number of Divisors

The number of divisors of  $n$  is about  $\sqrt[3]{n}$ .

$n$	6	60	360	5040	55440	720720	4324320	21621600
$d(n)$	4	12	24	60	120	240	384	576

### 8.2 Number of digits of $n!$ in base $b$

$$\log_b n! = \log_b(1 \times 2 \times 3 \times \dots \times n) = \log_b 1 + \log_b 2 + \log_b 3 + \dots + \log_b n$$

### 8.3 Prime counting function - $\pi(x)$

Expected to have  $\frac{x}{\log x}$  primes within  $[1, x]$ . The prime counting function is asymptotic to  $\frac{x}{\log x}$ , by the prime number theorem.

$x$	10	$10^2$	$10^3$	$10^4$	$10^5$	$10^6$	$10^7$	$10^8$
$\pi(x)$	4	25	168	1 229	9 592	78 498	664 579	5 761 455

### 8.4 Sum of digits of $n$ in base $b$

$$f(n, b) = \begin{cases} n & n < b \\ f\left(n, \left\lfloor \frac{n}{b} \right\rfloor + (n \bmod b)\right) & n \geq b \end{cases}$$

### 8.5 Fermat's Theorems

Let  $P$  be a prime number and  $a$  an integer, then:

$$a^p \equiv a \pmod{p}$$

$$a^{p-1} \equiv 1 \pmod{p}$$

**Lemma:** Let  $p$  be a prime number and  $a$  and  $b$  integers, then:

$$(a + b)^p \equiv a^p + b^p \pmod{p}$$

**Lemma:** Let  $p$  be a prime number and  $a$  an integer. The inverse of  $a$  modulo  $p$  is  $a^{p-2}$ :

$$a^{-1} \equiv a^{p-2} \pmod{p}$$

## 9 Identities

$$\sum_{i=1}^n i = \frac{n(n+1)}{2} \quad \sum_{i=1}^n i^2 = \frac{n(n+1)(2n+1)}{6} \quad \sum_{i=1}^n i^3 = \left(\frac{n(n+1)}{2}\right)^2$$

$$\sum_{i=1}^n \frac{1}{i} \approx \log n \quad \sum_{i=0}^{\infty} \frac{1}{2^i} = 2$$

## 10 Progressions

### 10.1 Arithmetic Progression

#### 10.1.1 General Term

$$a_1 + (n - 1)r$$

#### 10.1.2 Sum

$$\frac{(a_1 + a_n)n}{2}$$

**10.1.3 Sum of Second Order Arithmetic Progression**

$a_1$  is the first element of the original progression,  $b_1$  is the first element of the derived progression,  $n$  is the number of elements of the original progression and  $r$  is the ratio of the derived progression

$$a_1 n + \frac{(b_1 n(n-1))}{2} + \frac{rn(n-1)(n-2)}{6}$$

**10.2 Geometric Progression****10.2.1 General Term**

$$a_1 q^{n-1}$$

**10.2.2 Sum**

$$\frac{a_1(q^n - 1)}{q - 1}$$

**10.2.3 Infinite Sum**

$$-1 < q < 1$$

$$\frac{a_1}{1 - q}$$
